This sequence was derived from the FAPESP Schistosoma mansoni EST
Genome Project. All sequences in the project were assembled and
annotated. This entry and all the assembled sequences can be seen
in the following URL http://bioinfo.iq.usp.br/schisto/

/U-CF-DUI is a normalized cDNA library containing the following tissue(s): Primary Lung Epithelial Cells The library was constructed according to Bonaldo, Lennon and Soares, Genome Research, 6:791-806, 1996. First strand containing a Not I site. Double stranded cDNA was ligated to an EcoR I adaptor, digested with Not I, and cloned directionally into pT773-pac vector. The oligonuclectide used to prime the synthesis of first-strand cDNA contains a library tag sequence that is located between the Not I site and the (dT)lab tail. The sequence tag for this

```
ector: pBluescript SK-; Site 1: EcoRI; Site 2: macure pods, ranging in age from 15 to 30 days lination, were collected from greenhouse-grown At harvest, seeds were removed from pods and pod walls were collected and immediately frozen distrogen. Pod walls were pooled for mRNA, was directionally ligated into the Unizap XR rom Stratagene and packaged using dispack III kaging extracts. Plasmids containing cDNA inserts is aged from the recombinant lambda-Zap phage using the helper phage and propogated in XLOIR cells."

PO1Y, MRNA was purified from each sample, pooled and cDNA synthesized. The CDNA was directionally cloned into lambda SAP II (Stratagene) in the EcoRI (5) and XhOI (3') sites. pBluescript II SK- plasmids were excised from the lambda ZAP clones by superinfection with Exhasised from the lambda ZAP clones by superinfection with Exhasist (Stratagene) phage. The library was normalized using method 4 described in Bonaldo et al (1996) Genome Research 6: 791-806."

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
